Research Summary

My research focuses on efficient LLMs, ranging from diffusion language models to speculative decoding. I develop pretraining methods that teach diffusion language models to self-correct, and tree-based speculative decoding methods that accelerate LLM inference.

Education

Purdue University
2024 – 2029 (Expected)

Ph.D. in Statistics — *West Lafayette, IN, United States*

- Research fields: Diffusion Language Models, Speculative Decoding
- Advisors: Prof. Guang Lin & Prof. Qifan Song

Duke University
2022 - 2024

M.S. in Statistics — *Durham, NC, United States*

- Research fields: Bayesian Nonparametrics, Markov Chain Monte Carlo, Quantile Regression
- Advisor: Prof. Surya Tokdar

Wuhan University
2018 - 2022

B.S. in Mathematics and B.A. in Economics — *Wuhan, Hubei, China*

- GPA: 3.8/4.0, Awards: Honor Graduate of Hongyi Honor College

Research Experiences

Fast Generation in Diffusion Models
July 2025 - present

- Developed Self-Correcting Discrete Diffusion (SCDD), the **first ELBO-based pretraining framework for diffusion LMs to learn to self-correct without remasking**.
- Improved parallel decoding efficiency at GPT-2 scale. Integrated into NVIDIA NeMo AutoModel.

Bayesian Sparse Learning of Joint Quantile Regression
Jan 2023 - Mar 2024

- Developed Bayesian sparse learning methods for joint quantile regression, capturing local and global sparsity.
- Implemented an MCMC sampler in C and evaluated the method with simulations in R and a biomedical case study.

Work Experiences

Research Intern, Ant Group
May 2026 - Sep 2026

- Inclusion AI LLaDA Team, mentored by Dr. Jianguo Li; researched diffusion language models and speculative decoding.
- Co-led the **UBTree** project: parallelized candidate-transition scoring with a bigram selector and developed **tree-native** training using high-temperature rollouts and renormalized KL supervision to improve branch diversity.
- Achieved **5.84–6.94× average speedup** on Qwen3-4B/8B; outperformed DARTree in all 28 benchmark comparisons.
- Outperformed **DSpark** in SGLang: 5.36×/4.78× average speedups over autoregressive decoding on Ling3-Flash-124B/Qwen3.8-27B, respectively, representing **19.1%/10.6% higher speedups than DSpark**.
